

Tradecopia

Quick Start & Setup Guide

Purpose: This compact guide (*18 pages*) provides everything needed to install, configure, and operate Tradecopia, a professional trade copier and risk management tool.

It's designed for traders managing multiple accounts, prop-firm participants, and asset managers who require fast, reliable trade replication.

Introduction

A1. What is Tradecopia ?

Tradecopia is a professional trade copier desktop solution and risk-management tool designed to replicate trades in real time across multiple trading accounts and platforms.

It supports multiple brokers and platforms, including Tradovate, NinjaTrader, Project X, and (soon) Rithmic.

This software is built for futures and multi-account prop trading workflows.

A2. Tradecopia is ideal for:

- Retail and professional traders managing multiple accounts.
- Prop-firm traders copying trades across funded accounts.
- Asset managers distributing trades to client accounts.
- Developers integrating trade automation via API.

A3. Key features

- **Cross-platform trade copying:** Tradovate, NinjaTrader, ProjectX and soon Rithmic.
- **Unlimited account batching:** Group and copy to multiple follower accounts.
- **Advanced risk management:** Daily limits, trailing drawdowns, symbol filters, and more.
- **Quick setup:** Desktop app for reliable, low-latency trade execution.

Supported Brokers & Platforms

Connect with top brokers to enhance your trading experience. Our platform ensures seamless integration with all major trading platforms.

Tradovate

NinjaTrader

TradingView

ProjectX

Rithmic

A4. Our Architecture Philosophy: Reliability by Design

✖ Cloud Copier VS Local App

Instead, let's clarify the key difference between multi-tenant cloud copiers and Tradecopia's architecture.

Think of a multi-tenant cloud copier like living in an apartment complex — everyone shares the same walls, plumbing, and electrical grid. If the building loses power, every apartment goes dark, no matter how carefully you maintain your own. A single configuration issue on their server can disrupt all users.

In some cloud systems, a single misconfiguration has even caused trades from one user to execute in another's account — an unacceptable risk for any serious trader.

✔ Tradecopia's approach is different.

Our local application is like owning your own house: you control your power, your internet, and your setup. If something breaks, it affects only you — not hundreds of neighbors.

And our single-tenant cloud (coming soon with Pro+) takes it a step further. Imagine having your own private home inside a gated community. You benefit from the shared infrastructure and security, but your utilities are fully independent. If your neighbor's power goes out, yours stays on.

When traders pay premium prices for multi-tenant copiers, they're often trusting shared systems that promise isolation but don't truly deliver it. We believe traders deserve better — real reliability, real control, and true data separation.

✔ Our mission is simple: To help traders grow safely and efficiently — delivering real value, performance, and transparency at a fair price.

A5. Understanding How the Local Trade Copier Works

A5.1. Key Basics

Tradecopia's Local Trade Copier is a pre-packaged application that runs directly on your own computer and internet connection.

Unlike cloud-based copiers, it doesn't depend on external servers or shared infrastructure — giving you maximum control, privacy, and speed.

However, because it operates locally, its reliability depends on the stability and performance of your own environment.

This includes factors such as:

- **Internet Connection:** A stable, wired (*Ethernet*) connection is strongly recommended. Wi-Fi or mobile hotspots may introduce latency or disconnections.
- **Hardware Performance:** A computer with sufficient CPU, memory, and fast disk speed ensures smooth processing of trade data and reduces risk of delays.
- **Operating System Stability:** Keeping your system updated and free of background load (such as antivirus scans, downloads, or other trading apps consuming heavy resources) will help maintain consistent performance.

With a stable Ethernet connection and a modern computer, Tradecopia can manage 50+ accounts seamlessly without issue.

A5.2. About Broker Connections and WebSockets

The Tradecopia app connects to your broker through WebSocket connections.

This is a real-time communication channel that allows instant synchronization between your trading accounts and the broker.

It's important to understand that brokers can close or reset these connections for various reasons, including:

- Temporary server maintenance or restarts
- Network congestion or latency between your system and the broker
- Session timeouts or authentication refresh requirements

These events are outside Tradecopia's control. When they occur, the copier automatically attempts to reconnect. However, users should monitor their setups—especially during active market hours—to ensure everything is running smoothly.

A5.3. Balancing Power and Responsibility

The local architecture of Tradecopia means your trades are executed without dependency on third-party servers, resulting in lower latency, higher privacy, and greater control.

But with that power comes the need for responsible setup and maintenance. Tradecopia is designed to be reliable and efficient, but it cannot compensate for unstable internet, underpowered hardware, or broker-side disruptions.

By ensuring your own environment is optimized, you'll achieve performance that rivals or exceeds most hosted solutions.

Section B.

Setting it up

B1. What requirements ?

- A computer that stays online PC/MAC or VPS (*recommended for 24/7 use*).
- We recommend at least 8GB RAM.
- Active broker or platform credentials and an active API key subscription (for Project X).
- A Tradecopia account (*register at tradecopia.com*).
- Stable internet connection.

B2. Installation & First Login

- > 1. Download the desktop installer from the Tradecopia website
 - > (*Login>Downloads>Download right version of computer*)
- > 2. Install as Administrator.
- > 3. Launch & Log in with your Tradecopia credentials.
- > 4. Explore the software – main navigation includes:
 - Dashboard
 - Connections
 - Copy Trade
 - Risk management
 - Trade analytics
 - Settings

B3. Add accounts

B3.1. Tradovate & Ninjatrader

- > 1. Go to Connections -> Add Connections.
- > 2. Choose platform (*Tradovate or Ninjatrader*).
- > 3. Select Live or Demo account.
- > 4. login with your credentials.
- > 5. Verify that said account status is **“Connected”**.

 **Info:** A single Tradovate connection links all accounts under the same prop firm.

B3.2. ProjectX

- > 1. Create a ProjectX Account
 - Visit <https://projectx.com/>
 - Sign up with your email and complete the verification process.
- > 2. Subscribe to API Access
 - After logging in, purchase or activate an API access subscription. This enables you to:
 - Link your trading platform(s) to Project.
 - Create and manage API keys for each account.
 - Project API Access is \$29/month & You can get 50% off with code topstep - making it \$14.50/month.
- > 3. Log Into Your Trading Platform
 - Open the platform you want to link (e.g. TopstepX or TFDX).
 - Make sure you're logged into the correct trading account.
- > 4. Link Platform to Project
 - In your platform (e.g. TopstepX or TFDX), go to: Settings > API > Link Account then authorize the connection when prompted.
- > 5. Generate API Key
 - Once linked, go to your platform Settings.
 - Create a new API key for Tradecopia access.
 - Reveal the key, then copy it manually (highlight + copy)
- > 6. Open Tradecopia & Add Connection
 - Log into the Tradecopia app.
 - Navigate to: Connections > + Add Connection and Select ProjectX from the supported platforms list.
- > 7. Enter Credentials In the connection form:
 - Choose your Prop Firm.
 - Enter your username (e.g. TopstepX or LucidTradingX username).
 - Paste the API key you copied earlier.
- > 8. Confirm & Finish
 - Click Add / Connect then wait few seconds for the connection to be established.
- > 9. Verify that said account status is **"Connected"**.

B4. Creating copy trading groups

✓ **Purpose:** Organize followers into risk-based or broker-based groups.

- > 1. Navigate to Copy Trade -> + Add Trading Group
- > 2. Name your group (e.g., "Apex - Medium Risk").
- > 3. Select and slide one account into Leader Account
- > 4. Do the same for multiple Follower Accounts
- > 5. Configure copy settings multiplier

The leader executes trades that will be replicated to all followers based on their quantity multipliers.

⚠ **Critical:** Tradecopia never places orders on the leader account; it only mirrors existing trades to followers. Our code has no functionality to place orders on the leader account, only to exit positions. Always use a live account as your leader, where you manually place trades.

⚠ **Important:** Each account can only belong to one group at a time. You cannot assign the same account to multiple groups.

The screenshot shows the 'Modify Copy Trading Group' interface. It has two tabs: 'Accounts Configuration' (active) and 'Group Settings'. The 'Accounts Configuration' tab is divided into three sections: 'Available Accounts', 'Leader Account', and 'Follower Accounts'.

- Available Accounts:** A list of three accounts with their IDs and balances:

Account ID	Balance
PAAPEX2513310000005	\$50615.97
PAAPEX2513310000006	\$50337.04
PAAPEX2513310000007	\$50416.12
- Leader Account:** A single account selected as the leader:

Account ID	Balance
PAAPEX2513310000001	\$52810.80
- Follower Accounts:** A list of three accounts with their IDs, balances, and quantity multipliers:

Account ID	Balance	Qty Multiplier
PAAPEX2513310000002	\$51320.35	1
PAAPEX2513310000003	\$51281.41	1
PAAPEX2513310000004	\$50831.77	1

At the bottom of the 'Accounts Configuration' tab, there are two buttons: '↓ Move All to Followers' and '↑ Move All to Available'. At the bottom right of the entire interface, there are 'Cancel' and 'Update Group' buttons.

B5. Risk Management Parameters

- ✓ **Purpose:** Tradecopia's risk engine runs in real time on every connected account. It continuously monitors trades and enforces your pre-defined rules automatically, helping protect capital and maintain discipline across all markets.

You can configure a variety of controls, including:

- Daily profit targets
- Maximum daily loss thresholds
- Trailing drawdown limits
- Trade frequency restrictions

Risk settings can be applied per account or group.

If the leader account breaches a risk rule, Tradecopia will automatically flatten all follower positions in the group as well. This ensures that risk breaches on the leader are immediately reflected across all connected followers.

- ☁ **Data Feed Required:** Risk management requires an active data feed to track account P&L in real time. Ensure data feeds are enabled in group settings for full protection.

- 🔄 **Group Sync Required:** Accounts must stay in sync with group configuration. Do not scale contracts or take partial exits on a single follower — this creates “drift,” and risk management / P&L tracking will no longer be accurate. Followers should either be flat or fully match the group configuration.

C1. Important Setup Tips for Reliable Trade Replication

C1.1. How to Run Tradecopia the Right Way

- ✓ **Unlimited Groups:** Create as many groups as you like, and customize contract sizes or multipliers for each follower account.
- ✓ **Pick a Leader & Followers:** Tradecopia automatically mirrors trades from leader to follower accounts.
- ✓ **Keep the App Running:** Continue placing trades the way you always have. You can trade from the Tradovate web or mobile app, NinjaTrader, or TradingView (with a Tradovate connection). As long as Tradecopia is running, your accounts will stay fully synced in the background.
- ✓ **Start from a Clean State:** After finishing a trade, reset before starting the next one. Use Flatten Group in Tradecopia or Exit at Mkt & Cxl in Tradovate to clear all positions and orders. This ensures nothing carries over and your next trades remain clean and perfectly in sync.
- ✓ **Multiple Groups Strategy:** Use multiple groups freely, but avoid having all groups in active positions at the same time. You can toggle Live P&L visibility anytime from the Copy Trade tab (top right).

C1.2. Using correctly ATM orders

i ATM Orders: In Tradovate, an ATM order is a linked set of instructions (entry, take profit, and stop loss). Always treat it as a single unit. Do not cancel just the TP or SL leg independently, as this may cause unexpected behavior. If adjustments are needed, modify the TP or SL directly.

Once a TP or SL is filled, clean up any remaining legs. After hitting your profit target, we strongly recommend using Exit at Market & Cancel in Tradovate or **Flatten Group** in Tradecopia to close all open orders. This prevents «ghost» or orphaned orders from lingering in your account.

We strongly recommend using ATM orders whenever possible.

If you place TP and SL orders separately instead of using an ATM, they aren't tied to the position — increasing the chance of drift or desynchronization.

Supported ATM Types

Supported:

- Simple Take Profit (TP) - Basic profit target orders
- Stop Market Stop Loss (SL) - Market stop loss orders only
- TP/SL Modifications - Adjusting existing TP/SL levels is supported

NOT Supported:

- Auto Trailing Stop Loss - Orders that automatically move SL levels are not supported
- Stop Limit Orders - Only Stop Market orders are supported for stop loss
- Double Bracket Orders - Nested bracket orders in Tradovate/NinjaTrader are not supported
- Complex ATM Strategies - Advanced ATM features with dynamic adjustments
- Important: Using unsupported ATM types may result in incomplete replication or synchronization issues. Stick to simple TP and Stop Market SL orders for reliable copy trading.

C1.3. Position Reconciler & Follower Protection

- ✔ **Recommendations:** The Position Reconciler automatically detects and corrects position drift to keep all accounts perfectly synchronized. When enabled, it ensures all accounts stay aligned by automatically closing any mismatched positions. When disabled, position drift may accumulate over time, requiring manual intervention. **We strongly recommend keeping this feature enabled.**
- ? **How it works:** If a group is active and a follower account gets into a position that the leader doesn't have (for example, follower limit orders are filled but the leader's are not), the reconciler will immediately exit that follower position to maintain synchronization. This ensures all accounts remain perfectly synchronized.
- **To prevent automatic exits:** If you want a follower account to hold positions independently, simply turn off that individual follower account's replication toggle or disable the group itself.
- ⚠ **Important:** Always exit trades and use Flatten Group after each trading session to prevent position drift and ensure clean account states.
- 2x **Quantity Multipliers:** Use quantity multipliers in Group Settings to scale follower positions relative to your leader account. A multiplier of 1 means followers trade the same quantity as you, while a multiplier of 2 means they trade double the quantity. This allows you to adjust position sizes based on account sizes and risk tolerance without changing your own trading strategy.
- ⚠ **Due Diligence & Monitoring:** Always perform your due diligence before live trading. Start with one follower account and monitor it closely for any discrepancies. Keep a follower account window open to verify that orders are being replicated correctly, positions are aligned, and there are no unexpected behaviors. This proactive monitoring helps catch issues early and ensures your copy trading setup is working as expected.
